(57) **ABSTRACT**

An alignment tool may be used to align a nock with respect
to an arrow having vanes. The alignment tool may include
a body, a connection member extending from the body, and
indicating surfaces that are spaced around the outer surface
of the alignment tool body at a relative angular orientation
that matches the angular orientation of the arrow vanes. The
connection member may be attached to the nock and then
both the tool and the nock may be rotated with respect to the
arrow to align the nock with respect to the arrow by aligning
the indicating surfaces with respect to the vanes.

METHOD AND APPARATUS FOR ALIGNING ARROW NOCKS

This application is a continuation of U.S. patent application Ser. No. 14/075,244 filed Nov. 18, 2013, entitled METHOD AND APPARATUS FOR ALIGNING ARROW NOCKS, which claims the benefit of U.S. Provisional Patent Application No. 61/846,141 filed Jul. 15, 2013, entitled METHOD AND APPARATUS FOR ALIGNING ARROW NOCKS, both of which are incorporated herein by reference.

I. BACKGROUND

A. Field of the Invention

This invention relates generally to arrows that are shot or fired by bows, crossbows and the like. More particularly, this invention relates to methods and apparatuses used to align arrow nocks to arrows.

B. Description of Related Art

FIG. 1 shows a known arrow **10** that may be shot or fired by a bow, a crossbow or other such device (hereinafter any and all devices that can propel or fire an arrow will be referred to as a “bow”). The arrow **10** may include a body **12** with an arrow head **14** positioned at the front end of the body **12** and three fletchings or vanes **16** positioned near the back end of the body **12**. The arrow head **14** is the portion that strikes a target when the arrow **10** is shot. The vanes **16** act as airfoils and stabilize the arrow **10** when it is in flight. A nock **18** may be positioned at the back end of the arrow **10**. The nock **18** has one end with an extension that is received in an opening in the arrow body **12**. At the opposite end, the nock **18** has a head with a bowstring reception surface, typically in the form of a groove, which receives the bowstring on the bow that propels the arrow **10**. More recently, it is known to provide arrows with lighted nocks. By “lighted” it is meant that a light source illuminates the nock so that the user can see the nock, and thus the arrow, after the arrow has been shot.

A known problem is properly aligning the nock, lighted or otherwise, with respect to the arrow. If the nock is not properly aligned, one or more of the vanes may contact the bow as the arrow is shot, decreasing the force and accuracy of the shot arrow. To assist with nock alignment, it is known to provide nocks with a tab or ridge on the head and to provide the arrow with an index or cock vane. Typically the index vane is provided with a unique color and thus is easily identified. To align the nock, the user inserts the extension of the nock into the arrow opening and then rotates the nock with his/her fingers with respect to the arrow until the tab is aligned with respect to the index vane. While the use of such nock tabs assist with alignment, they do not provide the precise alignment desired unless the user spends considerable time carefully rotating the nock while “eyeing” the relative position of the tab with the index vane.

What is needed is a tool and method to improve both the speed and accuracy of nock alignment with respect to an arrow.

II. SUMMARY

According to one embodiment of this invention, an alignment tool may be used with an associated arrow and an associated nock. The associated arrow may comprise (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation. The associated nock may comprise: (a) a connection surface that

2

is connectable to the arrow body; (b) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (c) an opening. The alignment tool may comprise: a body having an outer surface; a first connection member extending from the body; and, first, second and third indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first, second and third vanes on the arrow body. The alignment tool and associated nock may be rotatable with respect to the associated arrow when the associated nock is connected to the arrow body and the first connection member is inserted into the opening in the nock to align the nock with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes.

According to another embodiment of this invention, an alignment tool and lighted nock assembly may be used with an associated arrow. The associated arrow may comprise: (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation. The alignment tool may comprise: a body having an outer surface; a connection member extending from the body; and, first and second indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first and second vanes on the arrow body. The lighted nock assembly may comprise: a nock comprising: (1) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (2) an extension having a shape; an insert comprising: (1) a connection surface that is connectable to the arrow body; and, (b) an opening having a shape; and, an LED-battery combination component. The alignment tool and insert may be rotatable with respect to the associated arrow when the insert is connected to the arrow body and the connection member is inserted into the opening in the insert to align the insert with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes. The nock extension may be insertable into the opening of the aligned insert in a fixed number of relative positions based on the shape of the nock extension and the shape of the insert opening to align the nock with respect to the arrow. The LED-battery combination component may: (1) be received in both the insert opening and the nock opening when the nock assembly is attached to the associated arrow; and, (2) light the nock when activated.

According to yet another embodiment of this invention, an alignment tool, first nock and nock assembly may be used with an associated arrow. The associated arrow may comprise: (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation. The first nock may comprise: (a) a connection surface that is connectable to the arrow body; (b) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (c) an opening. The nock assembly may comprise: a second nock comprising: (a) a nock extension having a shape; and, (b) a bowstring reception surface that is designed to receive the associated bowstring to fire the associated arrow; and, an insert comprising: (1) a connection surface that is connectable to the arrow body; and, (b) an opening having a shape. The alignment tool may comprise: a body having an outer surface; a connection member extending from the body; and, first and second indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first and second vanes on the arrow body. The alignment

3

tool and first nock may be rotatable with respect to the associated arrow when the first nock is connected to the arrow body and the connection member is inserted into the opening in the first nock to align the first nock with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes. The alignment tool and insert may be rotatable with respect to the associated arrow when the insert is connected to the arrow body and the connection member is inserted into the opening in the insert to align the insert with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes. The nock extension may be insertable into the opening of the aligned insert in a fixed number of relative positions based on the shape of the nock extension and the shape of the insert opening to align the second nock with respect to the arrow.

III. BRIEF DESCRIPTION OF THE DRAWINGS

The invention may take physical form in certain parts and arrangement of parts, embodiments of which will be described in detail in this specification and illustrated in the accompanying drawings which form a part hereof and wherein:

FIG. 1 is a perspective view of a typical known arrow.

FIG. 2 is a back view of an arrow.

FIG. 3 is a side view of the back end of the arrow shown in FIG. 2 showing a nock according to some embodiments of this invention.

FIG. 4 is a front end view of the nock shown in FIG. 3.

FIG. 5 is a side view of the nock head shown in FIGS. 2 and 3.

FIG. 6 is a perspective end view of an alignment tool according to some embodiments of this invention.

FIG. 7 shows the shape of the opening in the nock shown in FIGS. 3-5.

FIG. 8 shows the shape of the connection member shown in FIG. 6.

FIG. 9 is a side view of the alignment tool shown in FIG. 6.

FIG. 10 is an end view of the alignment tool taken along line 10-10 in FIG. 9.

FIG. 11 is a top view of the alignment tool shown in FIG. 6.

FIG. 12 is an end view of the alignment tool taken along line 12-12 in FIG. 9.

FIG. 13 is a side view of a lighted nock assembly according to some embodiments of this invention.

FIG. 14 is an exploded view of the lighted nock assembly shown in FIG. 13.

FIG. 15 is a perspective view of the nock shown in FIG. 14.

FIG. 16 is a side view of the nock shown in FIG. 14.

FIG. 17 is a top view of the nock shown in FIG. 14.

FIG. 18 is a sectional view of the nock taken along the line 18-18 in FIG. 19.

FIG. 19 is an end view of the nock taken along the line 19-19 in FIG. 16.

FIG. 20 is an end view of the nock taken along the line 20-20 in FIG. 16.

FIG. 21 is a perspective view of the insert shown in FIG. 14.

FIG. 22 is a side view of the insert shown in FIG. 14.

FIG. 23 is a top view of the insert shown in FIG. 14.

FIG. 24 is a sectional view of the insert taken along the line 24-24 in FIG. 25.

4

FIG. 25 is an end view of the insert taken along the line 25-25 of FIG. 22.

FIG. 26 is an end view of the insert taken along the line 26-26 of FIG. 22.

FIG. 27 is a back end view of an arrow with a nock attached to the arrow.

FIG. 28 is a back end view of the arrow shown in FIG. 27 but with the alignment tool attached to the nock.

FIG. 29 is a back end view similar to that shown in FIG. 28 but with the alignment tool and nock rotated to align the nock with respect to the arrow's vanes.

FIG. 30 is a back end view of an arrow with an insert attached to the arrow.

FIG. 31 is a back end view of the arrow shown in FIG. 30 but with the alignment tool attached to the insert.

FIG. 32 is a back end view similar to that shown in FIG. 31 but with the alignment tool and insert rotated to align the insert with respect to the arrow's vanes.

IV. DETAILED DESCRIPTION

Referring now to the drawings wherein the showings are for purposes of illustrating embodiments of the invention only and not for purposes of limiting the same, and wherein like reference numerals are understood to refer to like components, FIG. 2 shows the back end of an arrow 20 which may be a typical known arrow. The arrow 20 may have a body 22, an arrow head (not shown but which may be similar to arrow head 14 shown in FIG. 1) and vanes 24. The back end of the body 22 may have an outside diameter OD. This back end is the location on the arrow 20 where a nock may be attached to the body 22. The body 22 may have a cylindrical opening 26 which extends along the length of the arrow 20 as is typical in arrows. The vanes 24 may extend outwardly from the body 22, as shown, and may have an angular orientation. For the embodiment shown, the angular orientation is an angle A1 between neighboring vanes 24 of 120 degrees. This is typical for arrows as it provides desirable stabilization for the arrow 20 when it is in flight. It should be noted, however, that this invention will work with any arrow chosen with the sound judgment of a person with skill in the art, including vanes having a different number of vanes and/or having a different angular orientation.

With reference now to FIGS. 2-3, a nock 30 may be attached to the arrow 20. The nock 30 may have a connection surface 32 that is connectable to the arrow body 22 and a bowstring reception surface 34 that is designed to receive the bowstring of a bow in order to propel or fire the arrow 20. The nock 30 may have a first end with an extension 38 that defines the connection surface 32 but it should be understood that this invention will work with nocks that connect to arrow bodies in other ways. The extension 38 may have a generally cylindrical shape, as shown. The outer surface of the extension 38 may be smooth, in one embodiment, or may have a textured surface as in the embodiment shown. To attach the nock 30 to the arrow 20, the extension 38 may be inserted into the opening 26 until a portion of a head 36 opposite the bowstring reception surface 34 contacts the back end of the arrow body 22. The nock 30 may be held in place by a friction fit or press fit between the extension 38 and the surface of the arrow 20 that defines the opening 26 although other methods of holding the nock 30 to the arrow 20 may also work with this invention, such as using an adhesive.

With reference now to FIGS. 3-5, the nock 30 may have a second end with the head 36 upon which the bowstring

5

reception surface 34 is formed. The bowstring reception surface 34 shown is designed to receive a bowstring in any one of three relative orientations, indicated with dashed lines O1, O2 and O3. It should be noted, however, that this invention will work with nocks having other bowstring reception surface designs. The bowstring reception surface 34 may comprise pairs of grooves 40 on opposite sides of an opening 42 to form the three bowstring reception orientation options. The grooves 40, and thus the bowstring reception surface 34, extend inwardly a maximum distance D4. The opening 42 extends inwardly a distance D5. Note that distance D5 is greater than distance D4. In one embodiment, the opening 42 extends all the way through the length of the nock 30.

With reference now to FIGS. 2-3 and 6-8, to properly align the nock 30 with respect to the vanes 16 on the arrow 20, an alignment tool 50 may be used. The alignment tool 50 may have a body 52 and a connection member 54. The connection member 54 may extend outwardly from the body 52, as shown. The connection member 54 may be shaped to be received within the opening 42 in the nock 30 so that once received within the opening 42, rotation of the alignment tool 50 will cause rotation of the nock 30 with respect to the arrow 20. In one embodiment, as seen best in FIG. 8, the outer surface of the connection member 54 is generally triangular in shape having three planar portions 56. Between the planar portions 56, the outer surface may have curved portions 58. The opening 42 in the nock 30, as seen best in FIG. 7 may have a matching shape with planar portions 60 and curved portions 62. While a triangular shape has advantages that will be described below, it should be understood that the connection member 54 and opening 42 can have any design chosen with the sound judgment of a person of skill in the art that permits rotation of the alignment tool 50 to cause rotation of the nock 30.

With reference now to FIG. 6, the attachment of the connection member 54 to the body 52 can be in any manner chosen with the sound judgment of a person of skill in the art. In one embodiment, the connection member 54 is made integrally, as one piece, with the body 52. In another embodiment, the connection member 54 can be selectively attached and detached from the body 52. In this case, a worn connection member 54 could be removed from the body 52 and a new connection member 54 could be added in its place. It is also contemplated to provide different connection members 54 having different sizes and/or shapes to correspond with different nocks. In this case, a connection member of one size and/or shape could be removed from the body 52 and replaced with a connection member of another size and/or shape.

With reference now to FIGS. 6 and 9-12, the body 52 of the alignment tool 50 may have any shape and size chosen with the sound judgment of a person of skill in the art. The body 52 may have at least two indicating surfaces 64 that are spaced around the outer surface of the alignment tool body 52 at a relative angular orientation that matches the angular orientation of the vanes 24 on the arrow body 22. In one embodiment, shown, there are three indicating surfaces 64 to match the number of vanes 24 on the typical arrow. For the embodiment shown, there is an angular orientation of 120 degrees, see angle A2 in FIG. 10, between the indicating surfaces 64 to match the 120 degree angular orientation of the vanes 24 on the arrow 20, as shown in FIG. 2. It should be understood, however, that the alignment tool body 52 can be designed to have indicating surfaces at any angular orientation to match the angular orientation of the vanes on an arrow. The indicating surfaces 64 can take any form

6

chosen with the sound judgment of a person of skill in the art. In one embodiment, the indicating surfaces 64 are markings or indicia applied to the outer surface of the alignment tool body 52. For the embodiment shown, the indicating surfaces 64 are surfaces that extend or project outwardly from the alignment tool body 52. In one embodiment, the indicating surfaces 64 have an angular orientation that matches the connection member 54. In one specific embodiment, as seen best in FIG. 10, the indicating surfaces 64 have an angular orientation that matches the curved portions 58 of the connection member 54. In an alternate embodiment, the indicating surfaces 64 could be positioned to have an angular orientation that matches the planar portions 56 of the connection member 54.

With continuing reference to FIGS. 6 and 9-12, the indicating surfaces 64 may be spaced from a longitudinal axis LA of the connection member 54. FIG. 10 shows three indicating surfaces 64 spaced distances D1, D2 and D3 from the longitudinal axis LA. It should be noted that for the embodiment shown, distances D1, D2 and D3 are greater than the outside diameter OD, shown in FIG. 2, of the back end of the arrow body 22. The embodiment shown also provides that distances D1, D2 and D3 are equal to each other but in another embodiment they are not equal. The outer surface of the alignment tool body 54 may extend inwardly between the indicating surfaces 64. For the embodiment shown, the outer surface of the alignment tool body 54 extends inwardly along a curved surface between the indicating surfaces 64.

Still referring to FIGS. 6 and 9-12, the alignment tool 50 may also have an attachment surface 66. The attachment surface 66 may be used to attach the alignment tool 50 to another object for safe keeping. The alignment tool 50 may, for example, be attached to a bow. For another example, the alignment tool 50 may be attached to a user's key chain or the like. While the attachment surface 66 may have any shape and size chosen with the sound judgment of a person of skill in the art, for the embodiment shown the attachment surface 66 includes an extension surface 68 that extends from the body 52 and an opening 77.

To use the alignment tool 50, shown in FIG. 6, with the nock 30, shown in FIGS. 3-5, the user may begin with the arrow 20 as shown in FIG. 2. The user may then attach the nock 30 to the arrow 20. In one embodiment, this is done by inserting the nock extension 38 into the arrow opening 26, as described above and shown in FIG. 27. The alignment tool 50 may then be attached to the nock 30. Alternatively, the user may attach the alignment tool 50 to the nock 30 and then attach the nock 30 to the arrow 20. To attach the alignment tool 50 to the nock 30, the user simply inserts the connection member 54 into the opening 42. To make this insertion, with reference to FIGS. 7-8, the planar portions 56 of the connection member 54 are juxtaposed to the planar portions 60 in the nock opening 42 and the curved portions 58 of the connection member 54 are juxtaposed to the curved portions 62 in the nock opening 42. Because, in the embodiment shown, there are three juxtaposed planar portions and three juxtaposed curved portions, there are three relative orientations where the alignment tool 50 can be received in the opening 42. All three work equally well, provided that the bowstring reception surface 34 is designed to receive a bowstring in any one of three relative orientations, as discussed above.

With reference now to FIGS. 3-6, once the alignment tool 50 has been attached to the nock 30, the nock 30 may be inserted into the opening 26 in the arrow 20 as described above (unless the nock 30 has already been inserted). FIG.

7

28 shows the alignment tool 50 attached to the nock 30 and the nock 30 attached to the arrow 20. To then align the nock 30 with respect to the vanes 24 on the arrow 20, it is only necessary to rotate the alignment tool 50, and thus the nock 30, with respect to the arrow 20 until the indicating surfaces 64 are aligned with respect to the vanes 24. With this invention, alignment can be quickly and easily seen by the user. This is shown, for example, in FIG. 29. It should be noted, however, that while proper alignment for the embodiment shown occurs when the indicating surfaces 64 and vanes 24 have the same angular orientation, in other embodiments proper alignment may occur when the indicating surfaces 64 and vanes 24 have different angular orientations (though they may maintain the same relative angular orientation, such as 120 degrees, for example). As an example of this embodiment, FIG. 28 might show proper alignment. All that is necessary is that the indicating surfaces 64 be properly aligned with respect to the vanes 24 for any particular application. Once proper alignment has been achieved, the user can easily remove the alignment tool 50 from the arrow 20 by removing the connection member 54 from the nock opening 42.

In another embodiment, a nock may be lighted. By "lighted" it is meant that a light source may illuminate the nock when activated so that the user can see the arrow after it has been shot. FIGS. 13-14, show the components of a lighted nock assembly 70 according to some embodiments of this invention. The lighted nock assembly 70 may include a nock 72, an LED-battery combination component 74, and an insert 76. The LED-battery combination component 74 may, in one embodiment, be activated by applying a compression force to the LED-battery combination component 74.

With reference now to FIGS. 13-20, the nock 72 may have a connection surface 80 that is connectable to the insert 76 and a bowstring reception surface 82 that is designed to receive a bowstring. For the embodiment shown, the nock 72 may have a first end with an extension that defines the connection surface 80 but it should be understood that this invention will work with nocks that connect to inserts in other ways. The extension may have a generally cylindrical shape, as shown. The outer surface of the extension may be smooth, in one embodiment, or may have a textured surface in another embodiment. For the embodiment shown, the outer surface of the extension may have slots 86, as shown. The extension may have an opening 88. The opening 88 may communicate with an opening 84, as shown. In one embodiment, the outer surface of the extension is generally triangular in shape having three planar portions 90 connected by three curved portions 92. The purpose for this shape will be discussed further below. The nock 72 may have a second end with a head 78 upon which a bowstring reception surface 82 is formed. The bowstring reception surface 82 may be designed to receive a bowstring in any one of three relative orientations, as described above, but this invention will work with nocks having other bowstring reception surface designs. The opening 84 may be formed in the head 78, as shown.

With reference now to FIGS. 2-3, 13-14 and 21-26, the insert 76 may have a connection surface 96 that is connectable to the arrow body 22 and an opening 98. The insert 76 may have a first end with an extension that defines the connection surface 96 but it should be understood that this invention will work with inserts that connect to arrow bodies in other ways. The extension may have a generally cylindrical shape, as shown. The outer surface of the extension may be smooth, in one embodiment, or may have a textured

8

surface in another embodiment. For the embodiment shown, the outer surface of the extension may have ribs 104 that extend longitudinally, as shown. While five ribs 104 are shown, any proper number of ribs could be used. The extension may have an opening 106 that communicates with the opening 98 which may be formed in a head 94, as shown. The end of the extension opposite the head 94 may have a wall 108 that encloses the extension. To attach the insert 76 to the arrow 20, the extension may be inserted into the opening 26 until an edge of the head 94 closest to the extension contacts the back end of the arrow body 22. The insert 76 may be held in place by a friction fit between the extension and the surface of the arrow 20 that defines the opening 26 although other methods of holding the insert 76 to the arrow 20 may also work with this invention.

With reference now to FIGS. 21-26, the opening 98 in the head 94 of the insert 76 may match the connection member 54 of the alignment tool 50 (shown in FIG. 6). In another embodiment, shown, the opening 98 also matches the outer surface of the extension of the nock 72 (shown in FIG. 15). In one specific embodiment, as seen best in FIG. 20, the opening 98 may have a matching triangular shape. Specifically, the opening 98 may have three planar portions 100 and three curved portions 102. This design permits the extension of the nock 72, and thus the nock 72, to be insertable into the insert 76 in at least one, three shown, specific relative positions.

To use the alignment tool 50, shown in FIG. 6, with the lighted nock assembly 70, shown in FIGS. 13-14, the user may begin with the arrow 20 as shown in FIG. 2. The user may first insert the insert 76 into the arrow opening 26. More specifically, the insert extension may be inserted into the opening 26 in the arrow 20 in the same manner as the nock extension 38, shown in FIG. 3, as described above and shown in FIG. 30. The alignment tool 50 may then be attached to the insert 76. Alternatively, the user may attach the alignment tool 50 to the insert 76 and then insert the insert 76 into the arrow 20. To attach the alignment tool 50 to the insert 76, the user simply inserts the connection member 54 into the opening 98 in the head 94, as seen best in FIGS. 21 and 25. To make this insertion the planar portions 56 of the connection member 54, shown in FIG. 8, are juxtaposed to the planar portions 100 in the insert opening 98, shown in FIG. 25, and the curved portions 58 of the connection member 54 are juxtaposed to the curved portions 102 in the insert opening 98. Because, in the embodiment shown, there are three juxtaposed planar portions and three juxtaposed curved portions, there are three relative orientations where the alignment tool 50 can be received in the opening 98. All three work equally well. FIG. 31 shows the alignment tool 50 attached to the insert 76 and the insert 76 attached to the arrow 20. Once the alignment tool 50 has been attached to the insert 76, the insert 76 may be inserted into the opening 26 in the arrow 20 as described above (unless the insert 76 has already been inserted). To then align the insert 76 with respect to the vanes 24 on the arrow 20, it is only necessary to rotate the alignment tool 50, and thus the insert 76, with respect to the arrow 20 until the indicating surfaces 64 are aligned with respect to the vanes 24. With this invention, alignment can be quickly and easily seen by the user. This is shown, for example, in FIG. 32. In some embodiments, the opening 77 may be used as a reference hole that is aligned with a cock vane (not shown). As with the nock noted above, alignment of the insert 76 with respect to the vanes 24 may vary depending on application. Once proper alignment has been achieved, the user

can easily remove the alignment tool **50** from the arrow **20** by removing the connection member **54** from the insert opening **98**.

The LED-battery combination component **74**, shown in FIG. **14**, may then be inserted into the opening **88**, shown in FIGS. **17-18**, in the nock **72**. In one embodiment, the LED-battery combination component **74** has an outer surface **110**, at least part of which may be held in place by a friction fit or press fit with inner surface **112** of the nock opening **88**. It should be noted, however, that other methods of holding the LED-battery combination component **74** to the nock **72** may also work with this invention. The nock **72** and LED-battery combination component **74** may then be simultaneously inserted into the openings **98** and **106** in the insert **76**, shown in FIGS. **24-25**, with the result shown in FIG. **13**. Note that for the embodiment shown, the nock head **78** remains outside the insert **76** when the notch extension is inserted into the insert opening **98**. Note also that for the embodiment shown in FIG. **13**, a gap **D6**, which may be about the thickness of a dime, is maintained between the head **78** of the nock **72** and the end of the insert **76** to prevent the LED from illuminating before it is desired. To make this insertion the planar portions **90** of the nock **72**, shown in FIG. **20**, are juxtaposed to the planar portions **100** of the insert opening **98**, shown in FIG. **25**, and the curved portions **92** of the nock **72** are juxtaposed to the curved portions **102** in the insert opening **98**. Because, in the embodiment shown, there are three juxtaposed planar portions and three juxtaposed curved portions, there are three relative orientations where the nock **72** can be received in the opening **98**. All three work equally well for the nock **72** as its contact surface **82**, as seen best in FIG. **19**, provides three bowstring reception areas that can be used to receive and contact the bowstring, as shown. In this way, the nock **72** is aligned both with respect to the insert **76** and with respect to the vanes **24** on the arrow **20**. When the lighted nock assembly **70** is attached to an arrow and the arrow is fired, the bowstring will contact the nock **72** closing the gap **D6** and causing the LED to illuminate.

With reference now FIGS. **11-14** and **17-18**, if it is desired to remove the nock **72** from the insert **74**, the user can simply grip the head **78** of the nock **72** and pull it out of the insert openings **98**, **106**. If the LED-battery combination component **74** was press fit or otherwise attached to the nock **72**, removing the nock **72** from the insert **74** will simultaneously remove the LED-battery combination component **74** from the insert **76**. The LED-battery combination component **74** can then be easily removed from the nock **72** by pulling it out of the nock opening **88**, if desired.

Numerous embodiments have been described herein. It will be apparent to those skilled in the art that the above methods and apparatuses may incorporate changes and modifications without departing from the general scope of this invention. It is intended to include all such modifications and alterations in so far as they come within the scope of the appended claims or the equivalents thereof. Further, the "invention" as that term is used in this document is what is claimed in the claims of this document. The right to claim elements and/or sub-combinations that are disclosed herein as other inventions in other patent documents is hereby unconditionally reserved.

We claim:

1. An alignment tool for use with an associated arrow and an associated nock, wherein:

the associated arrow comprises (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation;

the associated nock comprises: (a) a connection surface that is connectable to the arrow body; (b) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (c) an opening;

the alignment tool comprises:

a body having an outer surface;
a first connection member extending from the body;
and,

first, second and third indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first, second and third vanes on the arrow body; and,

the alignment tool and associated nock are rotatable with respect to the associated arrow when the associated nock is connected to the arrow body and the first connection member is inserted into the opening in the nock to align the nock with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes.

2. The alignment tool of claim 1 wherein the first connection member is selectively detachable from the body and a second connection member is selectively attachable to the body permitting the second connection member to replace the first connection member on the body.

3. The alignment tool of claim 2 wherein the first and second connection members differ in at least one of size and shape to correspond with different nocks.

4. The alignment tool of claim 1 wherein the first, second and third indicating surfaces extend outwardly from the alignment tool body.

5. The alignment tool of claim 1 wherein:

the connection surface has an outer surface comprising first, second and third planar portions and first, second and third curved portions;

the angular orientation of the first, second and third indicating surfaces matches one of: the first, second and third planar portions and the first, second and third curved portions of the connection surface.

6. The alignment tool of claim 1 wherein the outer surface of the body extends inwardly along curved surfaces between the first, second and third indicating surfaces.

7. An alignment tool and lighted nock assembly for use with an associated arrow, wherein:

the associated arrow comprises: (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation;

the alignment tool comprises:

a body having an outer surface;
a connection member extending from the body; and,
first and second indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first and second vanes on the arrow body;

the lighted nock assembly comprises:

a nock comprising: (1) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (2) an extension having a shape;

an insert comprising: (1) a connection surface that is connectable to the arrow body; and, (b) an opening having a shape; and,

an LED-battery combination component;

the alignment tool and insert are rotatable with respect to the associated arrow when the insert is connected to the

11

arrow body and the connection member is inserted into the opening in the insert to align the insert with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes; the nock extension is insertable into the opening of the aligned insert in a fixed number of relative positions based on the shape of the nock extension and the shape of the insert opening to align the nock with respect to the arrow; and,

the LED-battery combination component: (1) is received in both the insert opening and the nock opening when the nock assembly is attached to the associated arrow; and, (2) lights the nock when activated.

8. The alignment tool and lighted nock assembly of claim 7 wherein:

the opening in the insert comprises at least one planar portion and at least one curved portion;

the connection member has an outer surface comprising at least one planar portion and at least one curved portion;

the nock extension has an outer surface comprising at least one planar portion and at least one curved portion;

when the connection member is inserted into the insert opening: the at least one planar portion of the connection member is juxtaposed to the at least one planar portion of the insert opening; and, the at least one curved portion of the connection member is juxtaposed to the at least one curved portion of the insert opening; and,

when the nock extension is inserted into the insert opening: the at least one planar portion of the nock extension is juxtaposed to the at least one planar portion of the insert opening; and, the at least one curved portion of the nock extension is juxtaposed to the at least one curved portion of the insert opening.

9. The alignment tool and lighted nock assembly of claim 7 wherein:

the associated arrow body has an opening;

the insert comprises an extension defining the connection surface that is connectable to the arrow body by insertion of the insert extension into the arrow body opening;

the nock comprises an opening; and,

the LED-battery combination component is press fit within the nock opening so that when the nock is manually removed from the insert the LED-battery combination component remains with the nock.

10. The alignment tool and lighted nock assembly of claim 7 wherein:

the nock comprises a head from which the nock extension extends;

the nock head comprises the bowstring reception surface; and,

the nock head remains outside the insert when the nock extension is inserted into the insert opening.

11. The alignment tool and lighted nock assembly of claim 7 wherein:

the associated arrow body has an outside diameter OD at a location where the insert is connected to the arrow body;

the first indicating surface is spaced a distance D1 from a longitudinal axis of the connection member;

the second indicating surface is spaced a distance D2 from the longitudinal axis of the connection member;

D1 is greater than OD; and,

D2 is greater than OD.

12. The alignment tool and lighted nock assembly of claim 7 wherein:

12

the alignment tool comprises a third indicating surface that is spaced on the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the third vane on the arrow body; and,

the alignment tool and insert are rotatable with respect to the associated arrow when the insert is connected to the arrow body and the connection member is inserted into the opening in the insert to align the insert with respect to the arrow by aligning the third indicating surface with respect to the third vane.

13. An alignment tool, first nock and nock assembly for use with an associated arrow, wherein:

the associated arrow comprises: (1) a body; and, (2) first, second and third vanes extending outwardly from the body at an angular orientation;

the first nock comprises: (a) a connection surface that is connectable to the arrow body; (b) a bowstring reception surface that is designed to receive an associated bowstring to fire the associated arrow; and, (c) an opening;

the nock assembly comprises:

a second nock comprising: (a) a nock extension having a shape; and, (b) a bowstring reception surface that is designed to receive the associated bowstring to fire the associated arrow; and,

an insert comprising: (1) a connection surface that is connectable to the arrow body; and, (b) an opening having a shape;

the alignment tool comprises:

a body having an outer surface;

a connection member extending from the body; and,

first and second indicating surfaces that are spaced around the outer surface of the alignment tool body at a relative angular orientation that matches the angular orientation of the first and second vanes on the arrow body;

the alignment tool and first nock are rotatable with respect to the associated arrow when the first nock is connected to the arrow body and the connection member is inserted into the opening in the first nock to align the first nock with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes;

the alignment tool and insert are rotatable with respect to the associated arrow when the insert is connected to the arrow body and the connection member is inserted into the opening in the insert to align the insert with respect to the arrow by aligning the first and second indicating surfaces with respect to the first and second vanes; and,

the nock extension is insertable into the opening of the aligned insert in a fixed number of relative positions based on the shape of the nock extension and the shape of the insert opening to align the second nock with respect to the arrow.

14. The alignment tool, first nock and nock assembly of claim 13 wherein:

the insert opening comprises at least one planar portion and at least one curved portion;

the first nock opening comprises at least one planar portion and at least one curved portion;

the connection member has an outer surface comprising at least one planar portion and at least one curved portion;

the second nock extension has an outer surface comprising at least one planar portion and at least one curved portion;

13

when the connection member is inserted into the insert opening: the at least one planar portion of the connection member is juxtaposed to the at least one planar portion of the insert opening; and, the at least one curved portion of the connection member is juxtaposed to the at least one curved portion of the insert opening;

when the connection member is inserted into the first nock opening: the at least one planar portion of the connection member is juxtaposed to the at least one planar portion of the first nock opening; and, the at least one curved portion of the connection member is juxtaposed to the at least one curved portion of the first nock opening; and,

when the second nock extension is inserted into the insert opening: the at least one planar portion of the second nock extension is juxtaposed to the at least one planar portion of the insert opening; and, the at least one curved portion of the second nock extension is juxtaposed to the at least one curved portion of the insert opening.

15. The alignment tool, first nock and nock assembly of claim **13** wherein the connection member is selectively detachable from the body permitting a replacement connection member to replace the connection member on the body.

16. The alignment tool, first nock and nock assembly of claim **13** wherein the first and second indicating surfaces extend outwardly from the alignment tool body.

17. The alignment tool, first nock and nock assembly of claim **13** wherein the outer surface of the alignment tool

14

body extends inwardly along curved surfaces between the first and second indicating surfaces.

18. The alignment tool, first nock and nock assembly of claim **13** wherein:

the associated arrow body has an opening; and, the insert comprises an extension defining the insert connection surface that is connectable to the arrow body by insertion of the insert extension into the arrow body opening.

19. The alignment tool, first nock and nock assembly of claim **13** wherein:

the second nock comprises a head from which the second nock extension extends;

the second nock head comprises the bowstring reception surface for the second nock; and,

the second nock head remains outside the insert when the second nock extension is inserted into the insert opening.

20. The alignment tool, first nock and nock assembly of claim **13** wherein:

the associated arrow body has an outside diameter OD at a location where the insert is connected to the arrow body;

the first indicating surface is spaced a distance D1 from a longitudinal axis of the connection member;

the second indicating surface is spaced a distance D2 from the longitudinal axis of the connection member;

D1 is greater than OD; and,

D2 is greater than OD.
